Reflection Questions

1. Did your estimations reflect the actual effort?

Yes. The story point estimations were reasonably aligned with the effort required for each user story. Higher complexity tasks such as pallet location tracking and inventory management were assigned more story points, while simpler tasks received lower story points. During the sprint simulation, the work was completed according to these estimates without major deviations.

2. Was your backlog well-prioritized?

Yes. The backlog was prioritized based on the importance of warehouse operations and user impact. Core features such as inventory management, pallet location tracking, and inbound/outbound operations were given higher priority, while reporting and alerts were scheduled after the essential functionalities. This helped organize the sprint in a logical order.

3. How did your simulated sprint align with your plan?

The simulated sprint closely followed the planned workflow. User stories were moved from To Do to In Progress and then to Done as the sprint progressed. Two sprints were completed successfully, showing that the planned backlog items were executed and tracked according to the Scrum process.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed a steady reduction in the remaining story points as tasks were completed during the sprint. The progress generally followed the expected guideline, indicating that the workload was manageable within the sprint duration. It also demonstrated that the team had sufficient capacity to complete the planned work without significant delays.
